INTRODUCING EASYPATH

REDUCE YOUR PRI COSTS TODAY!

EasyPath acts as a bridge between a legacy phone system and a company's internet connection to provide the benefits and cost savings of SIP Trunking.

It can be used with a variety of minute plans and includes auto detecting disaster recovery, multi-site and remote phone E911 support, as well as full control via a portal.

Historically, when using PRI circuits, companies paid for physical voice connections in a "pay for capacity" service model. This model limited flexibility, hindered scalability, and increased cost due to underutilization of available (but paid for) PRI capacity.

In addition, physical voice lines have limited disaster recovery capability and face challenges when deployed in multi-location and remote phone (E911) applications.
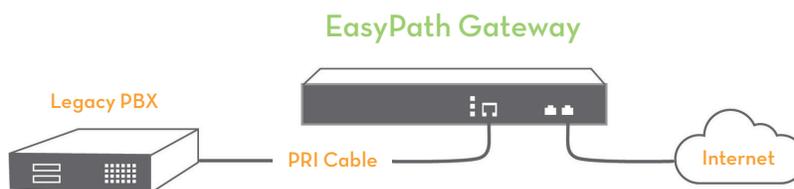

With an existing investment in PRI services, some may be hesitant to make an additional investment to migrate to SIP trunking.

EasyPath makes migrating simple and provides immediate savings by using cost effective SIP trunks in place of paying for more expensive PRI services. EasyPath adds control, scalability and failover capabilities while saving money.

Experience the cost savings and benefits of EasyPath while preserving your existing phone system investment!

The EasyPath solution includes a pre-engineered gateway which connects to your existing internet connection and PBX. Network managers now can utilize SIP over their existing internet connection, convert it to TDM (via EasyPath) at their office locations, and continue to use their existing voice system.

MIGRATING TO SIP TRUNKING MADE EASY WITH EASYPATH

EasyPath Gateway

Legacy PBX

PRI Cable

Internet

- EasyPath Gateway with PRI Delivery
- Number Portability/Local E911
- 23 or 46 Call Paths
